## ABSTRACT

Clothing is a basic human need in addition to food and shelter/shelter (home). humans need clothing to protect and cover themselves. Website or abbreviated as web is a collection of several pages that contain information in digital form, be it text, images, animations provided via the internet so that it can be accessed from all over the world. The process of ordering clothing, which in its current marketing is still manual, has an impact on the narrow range of orders. In addition, the recording of transactions is still manual, so if there are consumers who want to order clothes, they must come to meet a tailor. In the production of tailoring so far there is no information about the website that informs the manufacture of clothing, for this reason, The system that will be created is for ordering batik clothing. The research was conducted aiming to find out the problems that arise in the store every day. And get solution to solve it.

By using an information system for ordering clothing, customers can easily order clothing and services offered by shop owners.
