ABSTRACT

Sexual violence is a serious problem that often occurs to women and children in various parts of Indonesia, including on Bengkalis Island. People who experience sexual violence need to get the best service in handling and prosecuting the perpetrators of violence. However, in the current reporting, the community must come directly to the Bengkalis Regency Women's Protection and Child Empowerment Unit to report. This is of course less efficient. Therefore, an appropriate system is needed to improve this reporting process so that the community can consult and report more easily and quickly online. The purpose of this research is to create a sexual violence consultation and reporting application. The research method used is Extreme Programming Method. The result of this research is that the community is satisfied with this application because they can report and consult to the UPT of Women's Protection and Child Empowerment of Bengkalis Regency online in accordance with the expected results.
