ABSTRACT

Mading is a wall magazine which is a written communication medium, the delivery of which is usually displayed on the wall of a campus. Mading is also one of the information media that students often use in finding academic information on campus, the current wall magazine is still using the manual system, namely by sticking paper on the wall. This is less efficient and less attractive so that students are lazy to see and read the mading. The Mading Manual is currently less operational because students use social media more often to provide other student information. With these factors, the researcher built an online Mading Application for the Bengkalis State Polytechnic based on a website that students use to find information and provide information such as announcements, events, and others using the Extreme Programming (XP) method and there are several stages such as planning, design, coding and testing. resulting in a website-based online Mading Application that can make it easier for students to find academic information.

Keywords: *online mading, extreme programming, web*
