ABSTRACT

*Non-Cash Food Assistance (BPNT) is social assistance that is distributed non- cash from the government which is given to Beneficiary Families (KPM) every month through bank accounts, then used to buy food that has been determined. In the data processing process at the Social Service Office, there are still several obstacles, namely the dissemination of information on recipients of bpnt social assistance given to agents using Microsoft Excel, photocopies of family cards proposed by KPM candidates, as well as reports of distribution results in the formof paper that is prone to loss and damage, so special storage is needed. . This study aims to produce an application that can submit names of potential beneficiaries, verify data, make reports of constraints and distributions, to help manage BPNT aid data which can help search and check KPM data regularly. Trials were carried out on existing features in the system, and trials have been carried out on regional coordinators of BPNT, village task force, BSP assistants and several agents. Making this application using the PHP programming language, MySQL database and the Codeigniter framework. The test results show that the application can run well, such as the feature of adding recipient data, adding problem reports and distribution reports and being able to print pdf, print excel and print.*framework.
