ABSTRACT

Mbak Yanti Catering is a home-cooked food service provider, especially malay in Sungai Pakning, Bengkalis. Catering food orders are still very limited in scope. In Mbak Yanti Catering, it is still a manual or recording system for the ordering process, so catering entrepreneurs will have difficulty managing and carrying out the administrative process, this is certainly less efficient. And the ordering of the catering process, which is still done conventionally, certainly does not provide maximum results, because it requires a fairly long process. From these problems, a website-based catering application is proposed in the Mbak Yanti Catering business. The application is designed using PHP programming languages, MySql and uses the laravel framework as a database management system. The result of this website is in the form of an application that can manage data and contribute catering orders to the people of Sungai Pakning.
